                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                The invention relates to an isolated polynucleotide sequence or their complement encoding a polypeptide having a sequence at least 40% identical to DMT (DEMETER, previously known as ATROPOS (ATR)) Domain A, B or C or their combinations. Also included are an expression cassette comprising the polynucleotide or comprising a heterologous polynucleotide under the control of a promoter at least 70% identical to DMT 5' flanking sequence or an 5' untranslated region of DMT, a host cell comprising an exogenous polynucleotide encoding a DMT-like protein and a transgenic plant comprising a polynucleotide encoding a DMT-like protein. The expression cassette is
                              The invention relates to identifying target proteins (ABB90790-ABB94016) for herbicidally active compounds, comprising aligning and comparing nucleic acid or amino acid sequences from plant with nucleic acid or amino acid sequences from non-plant organisms using suitable search parameters, where plant sequences having an E-value sequences are selected. The polypeptides or nucleic acids encoding them are useful for identifying modulators. The identified modulators are
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  New polynucleotide that control plant development comprising a sequence having a specific homology to DEMETER domains A,B or {\tt C}

                                                                                                                                                                       protein in a plant results in a delay in flowering time, introduction of the protein into a cell results in modulation of methylation of chromosomal DNA in the cell, reduction of expression of the protein in a plant results in enhanced endosperm development and expressing of the protein in an Arabidopsis leaf results in expression of the MEDEA gene. The polynucleotide is useful for detecting a nucleic acid in a sample. DEMETER is related to 5-methylcytosine glycosylases and regulates transcription of target genes by demethylation. The present sequence represents a DMT-like protein.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         The invention relates to an isolated polynucleotide sequence or their complement encoding a polypeptide having a sequence at least 40% identical to DMT (DEMETER, previously known as ATROPOS (ATR)) Domain A, E or C or their combinations. Also included are an expression assette comprising the polynucleotide or comprising a heterologous polynucleotide under the control of a promoter at least 70% identical to DMT S' flanking sequence, DMT 3' flanking sequence or an 5' untranslated
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 New polynucleotide that control plant development comprising a sequence having a specific homology to DEMETER domains A,B or C
useful for modulating transcription. The method comprises introducing the cassette into a host cell preferably Agrobacterium by sexual cross, and selecting a host cell with modulated transcription, where the protein is capable of exhibiting at least one of the following biological activities, which include enhanced expression of the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 497 KVQLDPETSRVWKLLMSSIDCDGVDGSDEEKRKWWEEERNMFHGRANSFIARMRVVQGNR 556
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              1 KVXXDXXTXXXWXXLXXXXDXXXXXXXXXXXXXXXXEXXFXXXXXFIXRMXXXQGXR 52

"Molecular genetic analysis of myoc, a Dictyostelium myosin I.";
J. Cell Sci. 108:1093-1103(1995).
-!- FUNCTION: MYOSIN IS A PROPEIN THAT BINDS TO ACTIN & HAS ATPASE
ACTIVITY THAT IS ACTIVATED BY ACTIN.
-!- SUBUNIT: MYOSIN I HEAVY CHAIN IS SINGLE-HEADED. DIMER OF A HEAV
AND A LIGHT CHAIN. INABILITY TO SELF-ASSEMBLE INTO FILAMENTS.
-!- SIMILARITY: CONPAINS 1 MYOSIN-LIKE GLOBULAR HEAD DOMAIN.
-!- SIMILARITY: CONTAINS 1 SH3 DOMAIN.
                                                                               Nature 39:249-256(1997).
--- SUBCELLULAR LOCATION: Integral membrane protein (Potential).
--- SIMILARITY: BELONGS TO THE UPF0053 FAMILY.
--- SIMILARITY: CONTAINS 2 CBS DOMAINS.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               ;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Score 41; DB 1; Length 444;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 셤
                                                                                                                                                                                                                                                                                                                                               The invention relates to an isolated polynucleotide sequence or their complement encoding a polypeptide having a sequence at least 40% identical to DMT (DEMETER, previously known as ATRODOS (ATR)) Domain A, B or C or their combinations. Also included are an expression cassette comprising the polynucleotide or comprising a heterologous polynucleotide under the confrol of a prometra at least 70% identical to DMT, a host cell comprising an exogenous polynucleotide encoding a DMT-like protein. The expression cassette is polynucleotide encoding a DMT-like protein. The expression cassette is polynucleotide encoding a DMT-like protein. The expression cassette is useful for modulating transcription. The method comprises introducing the cassette into a host cell preferably Agrobacterium by sexual cross, and selecting a host cell preferably Agrobacterium by sexual cross, and selecting a host cell preferably adrobacterium by sexual cross, and selecting a host cell preferably in flowering time, introduction of the protein in a plant results in a delay in flowering time, introduction of the protein in a plant results in a delay in flowering time, introduction of the protein in an Arabidopsis leaf results in modulation of methylation of protein in an Arabidopsis leaf results in expression of the MEDEA gene. The polynucleotide is useful for detecting a nucleic acid in a sample. The polynucleotide is useful for detecting a nucleic acid in a sample. The protein of target genes by demethylation. The present sequence represents a DMT-like protein.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    1;
                                                                                                                                                                                                                                                                                 New polynucleotide that control plant development comprising a sequence having a specific homology to DEMETER domains A,B or C
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Gaps

The invention relates to an isolated polynucleotide sequence or their complement encoding a polypeptide having a sequence at least 40% identical to DMT (DEMPER) previously known as ATROPOS (ATR)) Domain A, B or C or their combinations. Also included are an expression cassette comprising the polynucleotide or comprising a heterologous polynucleotide under the control of a promoter at least 70% identical to DMT 5' flanking sequence, DMT 3' flanking sequence or an 5' untranslated region of DMT, a host cell comprising an exogenous polynucleotide encoding a DMT-like protein and a transgenic plant comprising a region of DMT a host cell comprising an exogenous polynucleotide encoding a DMT-like protein. The expression cassette is useful for modulating transcription. The method comprises introducing the cassette into a cell preferably Agrobacterium by sexual cross, and selecting a host cell with modulated transcription, where the protein is capable of exhibiting at least one of the following biological activities, which include enhanced expression of the protein in a plant results in a delay in flowering time, introduction of chromosomal DNA in the cell, reduction of expression of the protein in a plant results in a delay in flowering time, introduction of chromosomal DNA in the cell, reduction of expression of the protein in an Arabidopsis leaf results in expression of the protein in a natural of suseful for detecting a nucleic acid in a sample. DEMETER is related to 5-methylotycine glycosylases and regulates
                                                                                                                                                                                                                                                                                 New polynucleotide that control plant development comprising a sequence having a specific homology to DEMETER domains A,B or {\tt C}
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Gaps

                                                                                                                                                                                                                                                                                                 complement encoding a polypeptide having a sequence at least 40% identical to DMT (DEMETER, previously known as ATROPOS (ATR)) Domain A, B or C their combinations. Also included are an expression or C or their combinations. Also included are an expression or C or their combinations. Also included are an expression of DMT is the control of a promoter at least 70% identical to DMT 5' flanking sequence or an 5' untranslated are also DMT 5' flanking sequence or an 5' untranslated are agion of DMT. A host cell comprising an exceptions polynucleotide encoding a DMT-like protein. The expression cassette is useful for modulating transcription. The method comprises introducing the cassette into a host cell preferably Agrobacterium by sexual cross and selecting a host cell with modulated transcription, where the protein is capable of exhibiting at least one of the following blological activities, which include enhanced expression of the protein in a plant results in a delay in flowering time, introduction of chromosomal DNA in the cell, reduction of expression of the protein in a plant results in a delay in flowering time, introduction of chromosomal DNA in the cell, reduction of expression of the protein in an Arabidopsis leaf results in expression of the protein in an Arabidopsis leaf results in expression of the protein in a nature of succession of the protein in an Arabidopsis leaf results in expression of the protein in a DEMETER is related to 5-methylotycosine glycosylasses and requiates the company of the procession of the protein of the prote
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    5;

The invention relates to an isolated polynucleotice at least 40% identical to DMT (DEMETER, previously known as ATROPOS (ATR)) Domain A, B or Complement encoding a polypeptide having a sequence at least 40% identical to DMT (DEMETER, previously known as ATROPOS (ATR)) Domain A, B or C their compliations. Also included are an expression assette comprising the polywuclectide or comprising a heterologus polynucleotide under the control of a promoter at least 70% identical to DMT 5' flanking sequence or an 5' untranslated encoding a DMT-like protein. The expression cassette is polynucleotide encoding a DMT-like protein. The expression cassette is polynucleotide encoding a DMT-like protein. The expression cassette is useful for modulating transcription. The method comprises introducing the cassette into a host cell preferably Agrobacterium by sexual cross, and selecting a host cell preferably Agrobacterium by sexual cross, and selecting a host cell with modulated transcription, where the protein is capable of exhibiting at least one of the following biological activities, which include enhanced expression of the protein in a plant results in a delay in flowering time, introduction of chromosomal DNA in the cell, reduction of expression of the protein in a Arabidopsis leaf results in expression of the protein in a plant results in enhanced endosperm development and expressing of the DEMETER is related to 5-methylcytosine glycosylases and regulates

C DEMETER is related to 5-methylcytosine glycosylases and regulates

C DEMETER is related to 5-methylcytosine glycosylases and regulates

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          complement encoding a polymetrical having a sequence at least 40% identical to DMT (DEMETER, previously known as ATROPOS (ATR)) Domain A, B or complement encoding a polymetrically known as ATROPOS (ATR)) Domain A, B or C or their comprising the polymuclectide or comprising a hererologous cassette comprising the polymuclectide or comprising an exequence or an S' untranslated by DMT, a host cell comprising an exogenous polymuclectide encoding a DMT-like protein. The expression cassette is encoding a DMT-like protein. The expression cassette is useful for modulating transcription. The method comprises introducing the cassette into a host cell preferably Agrobacterium by sexual the protein is capable of exhibiting at least one of the following brotein is capable of exhibiting at least one of the following brotein in a plant results in a medulation of methylation of the protein into a cell results in modulation of methylation of the protein in an Arabidopsis leaf results in expression of the MEDEA general tresults in enhanced endosperm development and expressing of the protein in an Arabidopsis leaf results in expression of the MEDEA gene. The polymuclectide is useful for detecting a nucleic acid in a sample. DEMETER is related to 5-methylcytosine glycosylases and regulates transcription of target genes by demethylation. The present
                                                                                                                                                                                                                                                                                                                                                                                                                                                              3;
New polynucleotide that control plant development comprising a sequence having a specific homology to DEMETER domains A,B or C
                                                                The invention relates to an isolated polynucleotide sequence or their

The invention relates to an isolated polynucleotide sequence or their complement encoding a polypeptide having a sequence at least 40% and their compinations. Also included are an expression or c or their combinations. Also included are an expression or C or their combinations. Also included are an expression or C or their combinations. Also included are an expression or C or their combinations. Also included are an expression or DMT, a host cell comprising a percent of a promoter at least 70% identical to DMT, a host cell comprising an exogenous polynucleotide are protein and a transgenic plant comprising a conduing a DMT-like protein. The expression cassette is consisted in a host cell preferably Agrobacterium by sexual cross, and selecting a host cell preferably Agrobacterium by sexual cross, and selecting a host cell with modulated transcription, where the protein is capable of exhibiting at least one of the following bloodical activities, which include enhanced expression of the protein into a cell results in a delay in flowering time, introduction of the protein in an plant results in modulation of methylation of the protein in an hanced endosperm development and expressing of the protein in an handlogous leaf results in expression of the protein in a plant result in explain the cell, reduction of expression of the protein in an handlogous leaf results in expression of the protein in a plant result for detecting a nucleic acid in a sample. The polynucleotide is useful for detecting a nucleic acid in a sample. The polynucleotide a pum-like protein The present

                                                                                                                                                                                                                                      cross, and selecting a host cell with modulated transcription. Where the protein is capable of exhibiting at least one of the following biological activities, which include enhanced expression of the protein in a plant results in a delay in flowering time, introduction of the protein into a cell results in modulation of methylation of optimomorania DNA in the cell, reduction of expression of the protein in an arabidosperm development and expressing of the protein in an Arabidosperm development and expressing of the protein in an Arabidosper in capacity in expression of the MEDEA gene. The polynuclectine is useful for detecting a nucleic acid in a sample. DEMETER is related to 5-methylatycosine glycosylases and regulates transcription of target genes by demethylation. The present
                  or C or their combinations. Also included are an expression cassette comprising the polynucleotide or comprising a heterologous polynucleotide under the control of a promoter at least 70% identical to DMT 5' flanking sequence, DMT 3' flanking sequence or an 5' untranslated region of DMT, a host cell comprising an exogenous polynucleotide encoding a DMT-like protein and a transgenic plant comprising a polynucleotide encoding a DMT-like protein. The expression cassette is useful for modulating transcription. The method comprises introducing the cassette into a host cell preferably Agrobacterium by sexual
identical to DMT (DEMETER, previously known as ATROPOS (ATR)) Domain A,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                64 PCRTAMRGSFPLNGTYFQVNEVFADHCSSQNPIDVPRSWIWDLPRRTVYFGTSVPTIFRG 123

protein in a plant results in a delay in flowering time, introduction of the protein into a cell results in modulation of methylation of chromosomal DNA in the cell, reduction of expression of the protein in a plant results in enhanced endosperm development and expressing of the protein in an Arabidopsis leaf results in expression of the MEDEA gene. The polynucleotide is useful for detecting a nucleic acid in a sample. DEMETER is related to 5-methylcytosine glycosylases and regulates sequence represents a DMT-like protein. The present

cassette comprising the polynucleotide or comprising a heterologous bolynucleotide under the control of a promoter at least 70% identical to DMT 5' flanking sequence, DMT 3' flanking an exagence or an 5' untranslated region of DMT, a host cell comprising an exagence polynucleotide encoding a DMT-like protein and a transgenic plant comprising a polynucleotide encoding a DMT-like protein. The expression cassette is useful for modulating transcription. The method comprises introducing the cassette into a host cell preferably Agrobacterium by sexual cross, and selecting a host cell with modulated transcription, where the protein is capable of exhibiting at least one of the following protein in a plant results in a clay in flowering time, introduction of the protein into a cell results in modulation of methylation of the protein in the cell, reduction of expression of the protein in a
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     plant results in enhanced endosperm development and expressing of the protein in an Arabidopsis leaf results in expression of the MEDEA gene. The polynucleotide is useful for detecting a nucleic acid in a sample. DEMETER is related to 5-methylcytosine glycosylases and regulates transcription of target genes by demethylation. The present sequence represents a DMT-like protein.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              104 KXXXXLRTEHXVXXLPDXHXXLXX-----XDXXXYLLXIWXPXXXXXX----XXXXXXX 153

The invention relates to an isolated polynuclectide sequence or their complement encoding a polypeptide having a sequence at least 40% complement encoding a polypeptide having a sequence at least 40% complement encoding a polynuclesty known as ATRODOS (ATR)) Domain A, B or C or their combinations. Also included are an expression cassette comprising the polynucleotide or comprising a heterologous copynucleotide under the control of a promoter at least 70% identical to DMT 5 flanking sequence, DMT 3 flanking sequence or an 5 untranslated region of DMT, a host cell comprising an exogenous polynucleotide comprising an exogenous polynucleotide encoding a DMT-like protein and a transgenic plant comprising a computing transcription. The method comprises introducing useful for modulating transcription. The method comprises introducing cost the cassette into a host cell preferably Agrobacterium by sexual cross, and selecting a host cell with modulated transcription, where the protein is capable of exhibiting at least one of the following cross, and selecting a host cell with modulated transcription of the protein in a plant results in a delay in flowering time, introduction of the protein in a plant results in a delay in flowering time, introduction of the protein in a plant results in a delay in flowering time, introduction of chromosomal DNA in the cell, reduction of expression of the protein in an Arabidopsis leaf results in medulation of methylation of protein in an Arabidopsis leaf results in expression of the MEDEA gene. The polynucleotide is useful for detecting a nucleic acid in a sample. ComeMETER is related to 5-methylotosine glycosylases and regulates

C pageunce represents a DMT-like protein.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             New polynucleotide that control plant development comprising a sequence having a specific homology to DEMETER domains A,B or {\tt C}

The invention relates to an isolated polynucleotide sequence or their complement encoding a polypeptide having a sequence at least 40% identical to DMT (DEMPTER, previously known as ATROPOS (ATR)) Domain A, B or C or their combinations. Also included are an expression cassette comprising the polynucleotide or comprising a heterologous polynucleotide under the control of a prometer at least 70% identical to DMT 5' flanking sequence, DMT 3' flanking sequence or an 5' untranslated region of DMT, a host cell comprising an exogenous polynucleotide encoding a DMT-like protein and a transgenic plant comprising a polynucleotide encoding a DMT-like protein. The expression cassette is useful for modulating transcription. The method comprises introducing the cassette into a host cell preferably Agrobacterium by sexual cross, and selecting a host cell with modulated transcription, where the protein is capable of exhibiting at least one of the following biological activities, which include enhanced expression of the

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      The invention relates to an isolated polynucleotide sequence or their complement encoding a polypeptide having a sequence at least 40% dentical to DMT (DEMPTER, previously known as ATROPOS (ATR)) Domain A, B control to their combinations. Also included are an expression assette comprising the polynucleotide or comprising a heterologous polynucleotide under the control of a promoter at least 70% identical to DMT 5. flanking sequence, DMT 3. flanking sequence or an 5. untranslated region of DMT, a host cell comprising an exogenous polynucleotide encoding a DMT-like protein and a transgenic plant comprising a region of DMT, a host cell comprising an exogenous polynucleotide encoding a DMT-like protein. The expression cassette is useful for modulating transcription. The method comprises introducing the cassette into a host cell preferably Agrobacterium by sexual useful for modulating at least one of the following the protein is capable of exhibiting at least one of the following bloological activities, which include enhanced expression of the protein in a plant results in a delay in flowering time, introduction of plant results in enhanced endosperm development and expression of the protein in a plant results in enhanced endosperm development and expressing of the protein in an Arabitopsis leaf results in expression of the protein in a plant result for detecting a nucleic acid in a sample. The polynucleotide is useful for detecting a nucleic acid in a sample. The permanent and expression of the protein in a plant results of methylotosine glycosylases and regulates
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    3;

The invention relates to an isolated polynucleotide sequence or their complement encoding a polypeptide having a sequence at least 40% identical to DMT (DEMETER, previously known as ATROPOS (ATR)) Domain A, B or C or their combinations. Also included are an expression cassette comprising the polynucleotide or comprising a heterologous polynucleotide under the control of a promoter at least 70% identical to DMT 5 flanking sequence or an 5' untranslated region of DMT, a host cell comprising an exogenous polynucleotide encoding a DMT-like protein and a transgenic plant comprising a centranslated comprise in the polynucleotide encoding a DMT-like protein. The expression cassette is confounded in the protein and a transgenic plant comprises introducing the cassette into a host cell preferably Agrobacterium by sexual cross, and selecting a host cell preferably Agrobacterium by sexual cross, and selecting a host cell with modulated transcription, where the protein is capable of exhibiting at least one of the following brotein in a plant results in addition of expression of the protein in a plant results in andulation of methylation of chromosomal DNA in the cell. reduction of expression of the protein in an Arabidopsis leaf results in expression of the MEDEA gene. The polynucleotide is useful for detecting a nucleic acid in a sample. The polynucleotide is useful for detecting a nucleic acid in a sample. The protein in the present transcription of target genes by demethylation. The present

                                             The invention relates to an isolated polynucleotide sequence or their complement encoding a polypeptide having a sequence at least 40% identical to DMT (DEMETER, previously known as ATROPOS (ATR)) Domain A, B or C or their combinations. Also included are an expression cassette comprising the polynucleotide or comprising a heterologous cassette comprising the polynucleotide or comprising a heterologous polynucleotide under the control of a promoter at least 70% identical to DMT 5' flanking sequence, DMT 3' flanking sequence or an 5' untranslated region of DMT, a host cell comprising an exogenous polynucleotide encoding a DMT-like protein and a transgenic plant comprising a cencoding a DMT-like protein and a transgenic plant comprising a polynucleotide encoding a DMT-like protein. The method comprises introducing the cassette into a host cell preferably Agrobacterium by sexual cross, and selecting a host cell preferably Agrobacterium by sexual cross, and selecting a host cell preferably Agrobacterium by sexual cross, and selecting a host cell preferably Agrobacterium by sexual cross, and selecting a host cell preferably Agrobacterium by sexual cross, and selecting a host cell preferably advobacterium of the following bloogical activities, which include enhanced expression of the protein in a plant results in advolution of methylation of the protein in an Arabidopsis leaf results in expression of the MEDEA gene. The polynucleotide is useful for detecting a nucleic acid in a sample. Content of the protein in an Arabidopsis leaf results in expression of the MEDEA gene. The polynucleotide is useful for detecting a nucleic acid in a sample. Content of the MEDEA gene. The polynucleotide is useful for detecting a nucleic acid in a sample.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Э,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          1590 -GGKASGKMCFDETCSECNSLREANSQTVRGTLLIPCRTAMRGSFPLNGTYFQVNELFAD 1648

```
complement encoding a polypeptide having a sequence at least 40% of complement encoding a polypeptide having a sequence at least 40% of complement encoding a polypeptide having a sequence at least 40% of comprising the polynucleotide are an expression cassette comprising the polynucleotide or comprising a heterologous cassette comprising the control of a promoter at least 70% identical to polynucleotide under the control of a promoter at least 70% identical to comprising sequence. DAT 3' flanking sequence or an 5' untranslated region of DAT, a host cell comprising an exogenous polynucleotide encoding a DAT-like protein and a transgenic plant comprising a polynucleotide encoding a DAT-like protein. The expression cassette is copynucleotide encoding a DAT-like protein. The method comprises introducing the cassette into a host cell preferably Agrobacterium by sexual cross, and selecting a host cell with modulated transcription, where the protein is capable of exhibiting at least one of the following cross, and selecting a host cell with modulated transcription of the protein in a plant results in a delay in flowering time, introduction of the protein into a not the cell, reduction of expression of the protein in a hand results in modulation of methylation of the protein in an Arabidopsis leaf results in expression of the MEDDRA gene. The polynucleotide is useful for detecting a nucleic acid in a sample. Compensation of transcription of target genes by demethylation. The present compensation of transcription of transcription of marget genes by demethylation. The present
                                                                                                                                                                                                                                                                     New polynucleotide that control plant development comprising a sequence having a specific homology to DEMETER domains A,B\ {\rm or}\ C
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          1214 KNISQLRTEHRVYELPDEHPLLAQLEKREPDDPCSYLLAIWTP-GETADSIQPSVSTC-- 1270

AUTHORS: J. Sambrock, E.F. Frisch, T. Maniatis
AUTHORS: J. Sambrock, E.F. Frisch, T. Maniatis
TITLE: Molecular cloning: a laboratory manual
JOURNAL: Cold Spring Harbor Laboratory Press
DATE: 1989
PUBLICATION INFORMATION:
AUTHORS: J.W. VIIDLOGG, J. Madon, L. Dijkhuizen
TITLE: a plasmid from the methylotrophic
TITLE: actinomycetce Amycolatopsis methanolica capable of site-
TITLE: Specific integration
JOURNAL: J. Bacteriol.
VOLUME: 176
PAGES: 7087-7090
